(This isn't quite true, we use our best four or five, but using the best three helps reduce the chance of including a random item, so this simplification is good.) You may need to have two or more of the same kind of item for it to work, and when you roll, you'd roll them all. For example, you might roll as many 1s as you have rock, and do them in order. (Perhaps this is wrong; I'm not an expert on the task system.) So in essence, when we call for your character to use a specific item or item type, you're rolling dice to acquire that item type. But when you're just looking for an item, you're not rolling. You're just using your best guess at the number of dice to roll. Using your best guess for the number of dice to roll is useful, because you don't need to worry about a specific item, and you can still use the benefit of the doubt for lots of items. E.g. with the hook-dagger (a dagger that hooks onto a rope when thrown, for example), you're assuming that you'll get three dice. So when you're guessing for all the items, you're actually working out the best number of dice to roll. I think that's the gist of it. A: Yes, the item acquisition process in the rules works in the way you describe. Let's say you have the 'tarp'. You have to roll 3d6, and compare the result to your 'predicted' result (basically, what you think is the average of a roll of 3d6 on a typical dungeon map). If the result is higher than the predicted one, you take the item. If it's lower, you try again. In your situation, you have 'fire' (as the 'matching' item), and you want to know how many dice you should roll for the 'tarp'. The answer is, 'you should roll 4d6 to take the tarp'. Since there is only 1 'fire', you can take it when the result of 4d6 is higher than your predicted result. 'Fire' and the tarp are not really 'matching'. Fire doesn't fit with the 'tarp' and does not have the characteristics of a 'tarp'. However, because you have the 'tarp' and you think you 82157476af
